# General Production Practices

- **Apply nutrients based on soil test (pH 5.8 to 6.2)**
- **Avoid excessive Mg and K**
- Avoid fields with zinc
- Establish good rotations (cotton, corn, sorghum)
- Plant improved varieties in May
- 5 seed per foot of row on 36-inch rows
- Conventional tillage
- Irrigate if possible
- **Inoculate with *Bradyrhizobia* for BNF**
- Apply calcium at pegging
- Apply boron and manganese as needed
- Dig and harvest in a timely manner
- Control pests using IPM practices

**TABLE 3** Number of samples received from 2015 to 2018 to determine lime and fertilizer recommendations for peanut grown primarily in North Carolina

pH category	Samples from 2015–2018 ( <i>n</i> )	Acreage estimate for pH categories (% of samples)
<5.4	859	5.6
5.4–5.7	2,969	19.3
5.8–6.2	8,255	53.7
>6.2	3,279	21.4
Total	15,362	–

## Peanut response to soil pH and gypsum rate.<sup>a</sup>

Soil pH	Gypsum rate		
	0	0.5X	1.0X
	———— Percent of maximum yield ————		
4.5	42 f	55 e	55 e
5.2	55 e	56 e	59 e
5.6	78 c	78 c	69 d
6.0	84 b	97 a	95 a

<sup>a</sup>Data are pooled over 3 years.

## Potash Recommendations for Peanuts as Related to Potassium Soil Test Index (K-I), NCDA&CS.\*

Soil Test K-I	Potash (K <sub>2</sub> O) in lbs/acre
0	150
10	120
20	90
30	70
40	40
50	30
60	10
70	0

***Table 3-4. Peanut Yield Response and Economic Return at a Price of \$535 per ton in Fields without a History of Peanuts versus Fields with Frequent Plantings of Peanuts (1999 – 2017). Trials were conducted in North Carolina, South Carolina, and Virginia with Virginia market type varieties.***

<b>Inoculant Use</b>	<b>New Peanut Fields</b>		<b>Fields with a Recent History of Peanuts</b>	
	<b>Yield (lb per acre)</b>	<b>Economic return (\$ per acre)</b>	<b>Yield (lb per acre)</b>	<b>Economic return (\$ per acre)</b>
No inoculant	3,460	5	4,280	227
Inoculant	4,660	323	4,450	268
Difference	1,200	318	170	41
Number of Trials	52	52	43	43
Years	1999 – 2017		1999 – 2017	

# Applying Nitrogen to Peanuts

- Consider about 20 pounds N/acre on sandy soils to promote more rapid canopy closure and cooler soils at initial pegging
- Apply 500 pounds AMS/acre as soon as you notice symptoms of N deficiency and it is apparent that nodulation is poor (less than 10 nodules per plant 45 days after planting)
- Wet fields can decrease activity of nodules and cause peanuts to have a yellow cast – when fields dry they recover and generally the peanuts become green again
- Applied N is not recommended as a general rule for peanuts

***Table 3-5. Peanut Response from 14 Trials to Inoculation and Ammonium Sulfate at 571 lb/acre (120 lb actual N/acre) Applied when Nitrogen Deficiency Is First Visible.***

<b>Inoculant</b>	<b>Ammonium Sulfate</b>	<b>Pod Yield (lb/acre)</b>	<b>Net Return (\$/acre)</b>
No	No	3,530 c	20 c
Yes	No	4,850 a	353 a
No	Yes	4,550 b	271 b

Means followed by the same letter are not significantly different at  $p < 0.05$ .

# General Production Practices

- Apply nutrients based on soil test (pH 5.8 to 6.2)
- Avoid excessive Mg and K
- Avoid fields with zinc
- **Establish good rotations (cotton, corn, sorghum)**
- Plant improved varieties in May
- 5 seed per foot of row on 36-inch rows
- Conventional tillage
- Irrigate if possible
- Inoculate with *Bradyrhizobia* for BNF
- Apply calcium at pegging
- Apply boron and manganese as needed
- Dig and harvest in a timely manner
- Control pests using IPM practices

NC STATE

EXTENSION

## Using the Peanut Profile Board

Gather 150 harvestable pods from each field or from each variety within a field, collecting pods from four or five locations. Keep pods in water until pod blasting. Use a pressure washer equipped with a turbo nozzle to remove the outer hull and expose the mesocarp color layer. Your county Extension agent can assist with this procedure.

Using the images of pods at the top of each column, place pods on the profile board under the appropriate mesocarp color category. Lay pods loosely as shown here.

Lay pods on the chart and place them loosely within the appropriate mesocarp color category from the bottom line of the category upward. The percentage value on the right-hand side of the chart can be used to compare percentages of pods among color categories. In most cases, samples will resemble a bell-shaped curve. However, this occurs only when rainfall and temperatures promote predictable maturation. When weather conditions are unfavorable or when peanuts are damaged by pesticides, samples may not be uniformly distributed. This makes predicting the optimum digging date more difficult.

Use the percentage value on the right-hand side of the chart to determine if peanuts are at optimum maturity. When the percentages of both brown and black pods are at least 30 to 35%, peanuts are at optimum maturity.

The darker the mesocarp color, the more mature the peanut pod. Darker pods are heavier, will shrink less and will grade better than pods with a lighter mesocarp color.

Peanuts in the image below placed on a peanut profile board will reach optimum maturity in 10 to 14 days.

Sampling two or three times during the fall gives the best indication of the rate of peanut maturity. This is particularly important when examining pods that are black. These pods will eventually be lost and sampling only once does not give you enough information to determine when pods in the black category are likely to be lost. Using heat unit accumulations also can help you know when to begin determining maturity.

Note that when early morning temperatures are in high 40° F range for two days, pod maturation may not develop further unless there is a prolonged and unseasonal warming period.

## Determining Peanut Pod Maturity and Estimating the Optimal Digging Date

Using Pod Mesocarp Color for Digging Virginia Market Type Peanut

Maximum Weight 30% 50% 75% 95% 100%  
At least 35 days to black pod color 21 to 24 days to black pod color 14 to 17 days to black pod color 7 days to black pod color Black pods can shed within 4 to 7 days after becoming black

**Create Production Log Worksheet**

Creating a production log worksheet will allow you to record your production practices, crop development, and growing conditions during a growing season. Additionally, management practices currently selected on the "Risk" worksheet will be saved to the new log.

NOTE: The new log worksheet will be generated in the Excel workbook "Peanut\_Logs.xlsx" and not this workbook. The "Peanut\_Logs.xlsx" workbook will automatically be created if it does not exist in the same directory/folder as the "Risk Tool" workbook.

To create a new production log worksheet, simply enter a name for the log worksheet and click the create button.

**Table 4-5. Chemical Weed Control in Peanuts**

<b>Herbicide and Formulation</b>	<b>Pounds Active Ingredient Per Acre</b>	<b>Precautions and Remarks</b>
<b>Postemergence, Florida beggarweed</b>		
chlorimuron, MOA 2 (Classic 0.25 DF)	0.008 (0.5 oz)	Use only for control of Florida beggarweed. Apply from 60 days after crop emergence to within 45 days of harvest. Application to peanuts less than 60 days old will result in crop injury and yield reduction. Apply before Florida beggarweed has begun to bloom and before it has reached 10 inches tall. Larger beggarweed may only be suppressed. Add 1 quart of nonionic surfactant per 100 gallons spray solution; do not add crop oil. May be tank mixed with 2,4-DB; see label for rates and precautions. Recommended as a salvage treatment only.
<b>Postemergence, Yellow nutsedge</b>		
bentazon, MOA 6 (Basagran 4 L)	0.75 to 1 (1.5 to 2 pt)	Apply when nutsedge is 6 to 8 inches tall. A repeat application 7 to 10 days later may be needed. Adding crop oil concentrate at 1 quart per acre will increase control. Do not apply more than 2 pints of Basagran per season. Not effective on purple nutsedge.
<b>Postemergence, Yellow and purple nutsedge</b>		
imazapic, MOA 2 (Cadre 2 AS) (Impose 2 AS)	0.063 (4 fl oz)	Apply postemergence when nutsedge is 4 inches or less. Add nonionic surfactant at 1 quart per 100 gallons or crop oil concentrate at 1 quart per acre. See label for rotational restrictions.
imazethapyr, MOA 2 (Pursuit 2 AS)	0.063 (4 fl oz)	Apply before nutsedge is larger than 3 inches tall. Add surfactant at 1 quart per 100 gallons or crop oil concentrate at 1 quart per acre. Do not mix with Basagran for nutsedge control. See label for rotational restrictions. A split application with half of the Pursuit applied preplant incorporated and half applied early postemergence may be more effective than applying all of the Pursuit at one time.

Peanuts planted May 10, emerged May 20  
 Scouting date June 15 (what if July 1)  
 Next crop will be cotton (what if soybean)  
 Weeds present: Palmer amaranth  
Goosegrass  
Common ragweed

## UNTREATED DAMAGE ESTIMATE

(Based on 4000.0 lb / acre weed-free yield and \$600.00 per Ton selling price.)

Weed	weeds per 100 sq. ft.	Loss		
		lb / acre	% Yield	\$ / Acre
morningglory, tall	5.00	640.00	16.00%	\$192.00
sicklepod	4.00	576.00	14.40%	\$172.80
ragweed, common	2.00	304.00	7.60%	\$91.20
carpetweed	6.00	24.00	0.60%	\$7.20
<b>Total</b>		<b>1,544.00</b>	<b>38.60%</b>	<b>\$463.20</b>

# Treatment Details and Weeds Remaining

## Weed Control Details

Weed	Weed Population (weeds per 100 sq. ft.)	
	Initial	After Treatment
morningglory, tall	5.00	0.00
sicklepod	4.00	0.80
ragweed, common	2.00	0.10
carpetweed	6.00	0.00

## Estimated Yield Loss (Based on 4000.0 lb / acre weed-free yield)

Weed	Yield Loss (lb / acre)	
	Untreated	After Treatment
morningglory, tall	640.00	0.00
sicklepod	576.00	115.20
ragweed, common	304.00	15.20
carpetweed	24.00	0.00
<b>Total Estimated Loss</b>	<b>1,544.00</b>	<b>130.40</b>

## Purchase Information (Based on 40 acres)

Herbicide Name	Rate per acre	Units Needed	Unit Cost	Cost
Butyrac 200	16.0 oz	5 (gal)	\$29.32	\$146.60
Ultra Blazer (2S)	1.5 pt	8 (gal)	\$62.62	\$500.96
<b>Total Cost</b>				<b>\$647.56</b>

## North Carolina Herbicide Selection Tool

### Crop

Select crop for herbicide recommendation by clicking on crop name.

Peanut

Soybean

### Weeds

Select or unselect weeds for herbicide recommendation by clicking on a weed name.

carpetweed	morningglory	sandbur, field
cocklebur, common	entireleaf	sicklepod
corn, volunteer	ivyleaf	sida, prickly
crabgrass, large	pitted	signalgrass, broadleaf
croton, tropic	blue	smartweed, Pennsylvania
crowfootgrass	red	spurge
dayflower, spreading	purple/tall	velvetleaf
eclipta	mustard, wild	
foxtail, green	nightshade, black	
goosegrass	nutsedge	
groundcherry, cutleaf	purple	
horsenettle	yellow	

Selected Weeds	Comp. Index
amaranth, Palmer	4.0
millet, Texas	3.5

**Clear Selected Weeds**

Some weeds in North Carolina have resistance(s) to the following MOA(s). Check MOA(s) to exclude from recommendations because of confirmed resistance in any of the selected weeds or for management reasons to reduce the risk of developing herbicide resistance.
